**FAIL****Crack time (online)**

Estimated crack time under an online attack (1,000 guesses/second, rate-limited): less than a second.

**FAIL****Crack time (offline slow hash)**

Estimated crack time against a slow hash (bcrypt/Argon2 at 10,000,000 guesses/second): less than a second.

**FAIL****Crack time (offline fast hash)**

Estimated crack time against a fast hash (MD5/SHA-1 on NVIDIA RTX 3090 at 22,000,000,000 guesses/second): less than a second.

**FAIL****HIBP**

Password has been found in 15,123,766 known data breach records.

Recommendations

1. This password has been exposed in a known data breach. Choose a completely different password immediately.
2. Use a password with at least 12 characters.
3. Include at least one uppercase letter (A-Z).
4. Include at least one lowercase letter (a-z).
5. Include at least one special character (e.g. !@#\$%).
6. Avoid sequential patterns such as 'abc', 'xyz' or '123'.

7. Increase password complexity by combining multiple character classes and increasing its length.

8. Password is vulnerable to brute-force attacks under realistic conditions. Increase length and use a wider mix of character classes to significantly raise the estimated crack time.
